

## **Read Me – Task 2: Pick a Theme Description:**

This is a website where users can pick a theme from different options for elements like houses, doors, and windows. Each theme option corresponds to different styles, such as cartoon, pixel, or pencil drawing. The selected theme dynamically updates the displayed images on the page.

### **Usage:**

The user can click the “🎨” button to toggle the visibility of the theme selection grid. Once opened, a theme for each element type can be chosen (house, door, window) by clicking the radio buttons. The selected theme will be updated accordingly.

### **Encountered Issues:**

The two main difficulties I encountered were the radio button grid, making it responsive for both sides, the positioning of all the images and the intersection with the dropdown menu.

### **Future Implementations:**

To enhance the theme picker website, the following improvements could be added in the future:

- Improve the UI/UX design for better user interaction and feedback.
- Enhance the theme options with more diverse and customisable options

### **References:**

Images I have used are from the following websites (for the houses and the background):  
pngtree, megavoxels, freepik

Coding references are one codepen project and one instance of AI-generated help, which are all referenced in the comments.
